OG Gaming

Website Proposal & Implementation Plan

Slot booking, 5v5 matchmaking, tournaments, FACEIT verification and an admin control panel.

1. Executive Summary

OG Gaming is a CS-themed gaming zone with private cabins. Today, slot requests, team organisation and tournaments are handled manually, which costs time and leads to double bookings, no-shows and unverified players. This proposal describes a website that moves those workflows online: players request slots and register for tournaments, their FACEIT level is verified automatically, and the admin team is notified instantly and manages everything from one dedicated panel.

Goals

- Let players request game slots and join 5v5 matchmaking online.
- Open tournament registration with automatic FACEIT level verification.
- Notify the admin team instantly on every request and registration.
- Give admins a private page to manage tournaments, teams and bookings.
- Build a player community that keeps coming back (profiles, leaderboards, brackets).

Success measures

- Fewer manual messages and fewer double bookings or no-shows.
- Share of bookings and tournament sign-ups arriving through the site.
- Repeat visits per player and tournament turnout.
- Admin time spent per booking and per tournament.

2. Scope of Features

Features are grouped by phase. Phase 1 is the MVP and delivers the core vision on its own.

Area	Feature	Phase
Booking	Slot request form with cabin and time selection; live availability calendar	1
Matchmaking	5v5 request board: join solo or as a team, with a looking-for-players list	1
Verification	FACEIT nickname lookup (level, Elo) and ownership check via FACEIT login	1
Tournaments	Public tournament pages, team registration, entry limits, check-in	1
Notifications	Instant admin alerts by Telegram and email on requests and registrations	1
Admin panel	Role-protected page to approve/reject slots and manage tournaments, teams, players	1
Teams	Team creation, captain role, roster invites	2
Matchmaking+	Elo-based skill balancing for solo players	2
Tournaments+	Brackets (single/double elimination), score reporting, dispute handling	2
Community	Leaderboards, player profiles with match history, ban/blacklist list	2
Payments	Entry fees and deposits (manual screenshot first, then local gateway)	3
Memberships	Packages, monthly passes, promo and referral codes	3

Area	Feature	Phase
Analytics	Peak hours, revenue, active players, tournament turnout	3
Growth	Shareable tournament pages, sponsor slots, live stream embed, gallery	3

3. Key User Flows

Player: slot request

- Sign in (FACEIT login recommended) and choose date, time and cabin.
- Submit the request and see its status (pending, approved, rejected).
- Admin receives a Telegram/email alert and approves or rejects it.
- Player is notified of the decision and reminded before the slot.

Player: tournament registration

- Open a tournament page and register a team (or join as a solo player).
- System checks every player's FACEIT level against the tournament's allowed range.
- Eligible registrations are accepted into the list; admin gets an alert.
- On match day, players check in; no-shows are released automatically.

Admin

- Log in to the admin-only page.
- Review incoming slot requests and registrations from one inbox.
- Create and edit tournaments, manage teams and players, ban or approve users.

4. Technical Approach

The stack is chosen to ship quickly, stay cheap at venue scale and be easy to maintain by one developer.

Layer	Recommendation	Why
Frontend	Next.js (React) with Tailwind CSS	Fast, SEO friendly, mobile ready
Backend / DB	Supabase (Postgres, auth, realtime) or Firebase	Auth, database and realtime in one service
FACEIT	FACEIT Data API plus FACEIT OAuth login	Level and Elo lookup; proves account ownership
Notifications	Telegram bot and email (Resend or similar)	Free or near free; WhatsApp can come later
Hosting	Vercel for the app, Supabase for data	Free tiers cover an MVP
Access control	Role-based (player, captain, admin) with row-level security	Keeps the admin page private

Core data model (MVP)

users (profile, FACEIT id, level, Elo, role) • **cabins** • **slot_requests** (user, cabin, start/end, status) • **match_requests** (5v5 queue) • **teams** and **team_members** • **tournaments** (rules, level range, capacity,

dates) • **registrations** (team or user, status, check-in) • **notifications_log**.

Key technical points

- Double-booking is prevented with a database constraint on cabin and time range.
- FACEIT data is cached and refreshed, so the site stays fast and within API limits.
- Admin routes are protected on the server, not just hidden in the interface.
- The site is mobile first, since most players will book from their phones.

5. Implementation Plan

Estimates assume one developer working part-time. Dates are relative to the project start (Week 1).

Phase	Weeks	Deliverables
0. Discovery and design	1	Confirm rules (cabins, hours, tournament formats, level limits); wireframes; database schema; FACEIT API key; Telegram bot set up
1a. Foundation	2	Project setup, authentication with FACEIT login, user profiles, roles, base layout
1b. Booking and matchmaking	3 - 4	Availability calendar, slot requests with status, 5v5 request board, admin notifications
1c. Tournaments and admin	4 - 5	Tournament pages, registration with FACEIT level check, check-in, admin panel (slots, tournaments, teams, users)
1d. Test and launch (MVP)	5 - 6	Testing with real players, bug fixes, domain, deployment, admin training
2. Community and brackets	7 - 10	Teams and invites, Elo balancing, brackets and score reporting, leaderboards, ban list
3. Revenue and growth	11 - 14	Payments, memberships and promo codes, analytics dashboard, sponsor slots, streaming embed

Milestones

- **End of Week 2:** players can sign in and see their FACEIT level.
- **End of Week 4:** slot requests and matchmaking work with admin alerts.
- **End of Week 6:** MVP live with tournaments and the admin panel.
- **End of Week 10:** full tournament experience with brackets and leaderboards.

6. Cost Estimate

All figures are rough estimates in US dollars and should be confirmed before committing.

Running costs

Item	Early stage	At moderate traffic
Domain	$10 - 15 / year	$10 - 15 / year
Hosting (Vercel)	Free	About $20 / month
Database and auth (Supabase / Firebase)	Free	About $25 / month

Item	Early stage	At moderate traffic
Email and Telegram alerts	Free	Free to low
FACEIT API	Free	Free
Payment gateway (Phase 3)	No monthly fee	2 - 3% per transaction
WhatsApp Business API (optional)	Not in MVP	Per-message fees
Typical total	**$0 - 30 / month**	**Under $60 / month**

Build cost options

Option	MVP (Phase 1)	Full system (Phases 1 - 3)
Build in-house	Developer time only, about 5 - 6 weeks part-time	About 3 months part-time
Hire a freelancer	Roughly $800 - 2,500	Roughly $3,000 - 8,000

7. Risks and Mitigation

Risk	Mitigation
FACEIT API limits or changes	Cache player data, refresh on a schedule, handle API errors gracefully
Fake or borrowed FACEIT accounts	Verify ownership with FACEIT OAuth login, not just a typed nickname
Double bookings	Database-level constraint on cabin and time; admin can still override
Payment integration delays	Start with manual screenshot confirmation; add a gateway later
Scope creep	Ship the MVP first and prioritise Phase 2 and 3 using real usage
Single-developer dependency	Use common tools, document the setup, keep code in a private repository

8. Next Steps

- Confirm MVP scope and tournament rules (formats, level ranges, entry fees).
- Create the FACEIT developer account and Telegram bot.
- Approve the wireframes and database schema.
- Start Week 1 and review progress at the end of each phase.

Prepared for OG Gaming. Estimates are indicative and will be refined after the discovery phase.
